(435) 695-3478 ◊ yingjie.li@utah.edu

EDUCATION & EMPLOYMENT

University of Utah Doctor of Philosophy, Computer Engineering Advisor: Cunxi Yu Selected courses: Adv Digital VLSI, Deep Learning Systems, Graduate Algorithms, CAD of Digital Circuits, Computer Architecture	<i>2020-present</i>
DELL EMC, Shanghai, China Hardware Engineer	<i>2019-2020</i>
Cornell University M.Eng, Electrical and Computer Engineering	<i>2018-2019</i>
Huazhong University of Science and Technology B.S., Electrical and Computer Engineering (Honor)	<i>2014-2018</i>

AWARDS

DAC Young Student Fellow, 2020 (winning presentation) and 2021
Outstanding Graduates, Huazhong University of Science and Technology, 2018

PROJECTS

- **LightRidge: End-to-end photonic compiler framework for optical neural networks**
This work is the first effort in building modern Physics Compiler, specifically, a *photonic compiler* framework to deal with fundamental optical physics and emerging optical computing system emulations(<https://ycunxi.github.io/lightbridge/index.html>). **It features with a) heterogeneous HPC accelerated physics engines, b) highly versatile and flexible optical physics modelling, c) user-friendly front-end APIs, d) and backend hardware deployment supports.** This enables a complete full-stack design and exploration from ML algorithms, to hardware-software codesign, finally to the hardware and device level.
Publications: *ROAD4DNN@DAC21, ISCA22* (to be submitted)
- **Discrete and Differentiable Device-to-System Co-Optimization using Gumbel-Softmax**
This work Realizes quantization with arbitrary digits in Hardware-Software Codesign in Optical Neural Networks. Exploring the best algorithm for Gumbel-Softmax with LightRidge, we can train the model with quantization for the hardware to close the gap between simulation and experiments.
Publications: *ICLR'22* (under review)
- **Real-world All-optical Multi-task Learning with Physics-aware training** We explore two research directions in realizing cost-efficient multi-task learning (MTL) problems using D2NNs – **1)** the first one focuses on real-time MTL with single optical detectors and **2)** the second one introduces a first-of-its-kind *physical rotation aware* training to enable weights sharing in post-fabrication system, all performed with our LightRidge compiler.
Publications: *AAAI'22 (under review), Springer Nature Scientific Report* 2021.
- **Physical Adversarial Attacks of Diffractive Deep Neural Networks** To study vulnerability and robustness of optical neural networks, we develop the first adversarial attack formulations over optical physical meanings, and provide a comprehensive analysis of adversarial robustness of D2NNs under practical adversarial threats over optical domains. This is also the first work on analyzing adversarial robustness of complex-valued neural networks.
Publications: *DAC'21.*

PUBLICATIONS
